FACTS ABOUT

Forests & Jungles

Desirée Vorel

THE GOOD AND THE BEAUTIFUL LIBRARY

When you look outside,
what looms tall over the
land? Trees!

Forests grow all over the world. They cover one-third of the land!

They stay in the next kind of forest: mild forests. These forests grow in places that aren't too cold or too hot.

Eastern Fox Squirrel

Tree holes make good homes for bats and cute little animals like this one.

Jungles grow near rainforests. They are both found around the Equator.

Rainforests have many trees, so they are dark, but jungles have fewer trees, so they are sunny.

All that sunlight helps
many plants to grow
between the trees.

Coronated Lemur

The plants grow so close
they become tangled.

FACTS ABOUT

Forests & Jungles

Young readers will go on a journey around the globe as they explore the world's forests and jungles! From trees to flowers, from insects to large mammals, readers will encounter some of the most interesting and unique of God's creations in these places.
